
Installation of JACLPlus failed

Posted by marcmenendez - 2008/02/14 18:27

Hi,

I'm just installed Joomla! 1.0.13.
Here is my configuration

For my tests, my Web server is on my local computer (Apache 2.2.6 with PHP 5.2.5).
Mysql is running on a W2003 server.

In previous tests, with the same configuration, I could install other components with no problem. Of course, for this last one, I erased everything before, and started with a fresh and cleaned Joomla!

So, I installed the component. I use the JACL 1.0.13

After a few seconds, I get a page titled "Patch Component for Joomla!/Mambo" with a list of files patched.

But, this page tells to click on "Continue". Unfortunately, there is no "Continue" link...

I had a glance to the source of this web page : the list of files is in a HTML table tag which does not end. Even more : the page does not end (no </table> tag !) :blink:

So I suppose the page generation was interrupted and so the patch failed... but why ? how to know ? Is there a log ? :dry:

In the component menu, there is no JACL item, just a "Patch Component" with the famous page I was talking about above...

Can somebody help me ?

Thanks a lot !
